

Global Trends in Mental Health Disorder

From Schizophrenia to Depression

By Amit [source]

About this dataset

This dataset contains informative data from countries across the globe about the prevalence of mental health disorders including schizophrenia, bipolar disorder, eating disorders, anxiety disorders, drug use disorders, depression and alcohol use disorders. By providing this data in an easy to visualise format you can gain an insight into how these issues are impacting lives; allowing for a deeper understanding of these conditions and the implications.

Through this reflection you may be able to answer some important questions:

- What are the types of mental health disorder that people around the world suffer?
- How many people in each country suffer mental health problems?
- Are men or women more likely to have depression?
- Is depression linked with suicide and what is the percentage rate?
- In which age groups is depression more common?

From exploring patterns between prevalence rates through in-depth data visualisation you'll be able to further understand these complex issues. The knowledge gained from this dataset can help bring valuable decision making skills such as research grants, policy making or preventative intervention plans across various countries. So if you wish to create meaningful data viz then start with this global prevalence of mental health disorder's together with accompanying videos for extra context - Deepen your understanding about Mental Health Disorders today!
